

Input

What were the minimum and maximum wind speeds recorded today?
How long did wave heights remain above safe sailing limits?
How does the current sea state compare with yesterday's peak?
Are conditions currently suitable for crew transfer vessels?
Are fish activity patterns changing with sea state conditions?
How has water temperature changed over the last 24 hours?
Which sensors are currently active at the Fife site?
Are any parameters trending toward unsafe thresholds?
How stable has wind direction been over the last 6 hours?
At what time did wave conditions become unsafe for sailing?
Based on current conditions, is crew transfer possible right now?
Has bird activity shown any correlation with wind conditions?
Are fish activity levels within normal seasonal ranges?
Which sensors are providing real-time wind and wave data?
Are there any data gaps or sensor outages in the last 24 hours?
Which parameter is currently the main operational constraint?
Are all conditions expected to remain within safety limits overnight?
Summarise all environment parameters with their latest values and safe/unsafe status
Are current environmental conditions within operational safety limits?
List all environmental data sources shown on the map.
Show the satellite view of the Fife, Scotland turbine area.
Where exactly is the wind turbine site on the map?
What's the phytoplankton index right now?
Give me the current water temperature and salinity.
What is the current noise level underwater?
Has seabed disturbance increased in the last day?
What are the latest readings for bird activity and fish activity?
Compare sea state readings between this morning and now.
When will it be safe to sail again based on forecasted wave conditions?
Plot the trend of wave heights through the last 24 hours.
Have wave heights exceeded 1.5 m at any point today?
What is the current sea state and wave height?
Show me the average wind speed and direction for the last 12 hours.
At what time today were the highest wind speeds recorded?
Is it currently safe to operate based on wind speed conditions?
How has wind direction changed over the past 24 hours?
What is the current wind speed at the Fife site?
Should the yaw ring gear be inspected for uneven wear?
Is the hydraulic pump cycle time still within the required tolerance?
Do we need to inspect the transformer cooling fans for performance drops?
Are the gearbox vibration signatures consistent with the baseline profile?
Should the blades be inspected for leading-edge erosion?
Has the blade pitch calibration drifted since the last storm event?
Is the turbine safety system audit up to date?
Do we have enough spare hydraulic seals for upcoming maintenance tasks?

Are there pending work orders that need reprioritization?

Should we consolidate multiple tasks into one extended shutdown?

When is the next full turbine service due according to OEM guidance?

Should rotor-speed limits be temporarily reduced due to icing risk?

Has the fire suppression system been tested this year?

Is the UPS system in the nacelle due for battery testing?

Do we need to inspect the lattice support frames for corrosion?

Tighten all bolts in the nacelle frame according to specifications.

Check the hydraulic cylinder for leaks and pressure drops.

Ensure the pitch actuator operates within the allowed speed range.

Verify the electrical connections in the converter are secure.

When did we last perform anti-corrosion inspection on tower access platforms?

Monitor the condition of the main gearbox oil level.

Check status of the grounding and lightning protection system at the base.

Do the yaw brake components need cleaning and lubricating?

Check the status of turbine maintenance.

What are corrective maintenance actions for a hydraulic system fault?

What are corrective maintenance actions for a gearbox fault?

What preventive maintenance actions can we carry out in this weather?

What is shadow flicker and does it affect today's operations?

Summarise system pressure changes during the storm last week.

Summarise maintenance log.

Do we need a turbine shut down given the weather forecast?

How many planned or scheduled actions are currently delayed?

Schedule oil change for gearbox for next week.

Remove planned maintenance on gearbox alignment.

Reschedule system inspection for early 2026.

What is the total power generated in the last 24 hours?

Show me the power output trend for the last day.

At what time was the highest generation recorded today?

How much energy did the turbine produce overnight?

Compare current generation with yesterday's average.

What is the current capacity factor for the turbine?

Is the turbine operating near its rated capacity?

How does today's capacity utilisation compare to last week?

What percentage of maximum output did the system reach today?

Estimate how long the turbine has been below 50 % capacity.

What is the current estimated LCoE?

How does the LCoE compare to previous forecasts?

What would the cost per MWh be under today's generation profile?

Has the estimated LCoE decreased with higher production?

Provide a summary of production and LCoE for reporting.

Show forecasted power generation over the next 24 hours.

When is power output expected to peak in the forecast?

Does the forecast indicate any downtime or low-generation periods?

What is the operational status of the turbine?

List rated capacity, 24 h production, and current capacity utilisation for all turbines.
Why is the output fluctuating so much during the daytime on Dec 4?
How does the hub wind speed influence the predicted power?
Why does wind speed decrease significantly after 06:00?
How does the current energy price (£75.60/MWh) impact revenue for this period?
Is the turbine generating above or below expected profitability?
How does afternoon power performance compare to early-morning performance?
How consistent was the turbine's performance across different wind speeds?
Are any low-wind hours forecasted that could impact tomorrow's production?
Will the peak generation tomorrow exceed today's peak?
Are there any forecasted periods near zero generation?
How does today's variability compare to last week's stability?
Which three hours contributed the most to total daily energy generation?
Is there evidence of turbulence affecting power stability during peak winds?
What are the main differences between today's and yesterday's generation curves?
Is there a noticeable pattern of power dips during gusty conditions?
Did environmental factors (temperature, humidity) influence efficiency today?
Is tomorrow's generation expected to be more stable than today's?
